-!- FUNCTION: Thiol protease that hydrolyzes proteins, with a preference for Phe or basic residues.
-!- SUBCELLULAR LOCATION: Secreted.
-!- ALLERGEN: Causes an allergic reaction in human. Common symptoms of mite allergy are bronchial asthma, allergic rhinitis and conjunctivitis. Reacts with IgE in 80% of patients with house dust

agent combination of at least two of: an allergen; an antihistamine, and a histamine synthesis inhibitor. (I) is used for treating or preventing allergic hypersensitivity reactions, especially allergic asthma, allergic rhinitis or allergic atopic eczema, in babies, children or adults. The present sequence is cysteine protease from Dermatophagoides pteronyssinus, which was used as an allergen in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding allergens of house dust mite Dermatophagoides - and isolated protein allergens and peptide(s) useful in treating and detecting sensitivity to mites, esp. D. farinae.

In plasmid form as subclone from lambda gill (Chua et al., J. J. Bxp. Med. 167: 175-182 (1989). The CDNA was used to express a Dep pI allergen which was capable of raising an immune response when contacted with anti-Dep pI antibodies. The protein was used to design a series of werlapping peptides synthesised by standard techniques to cover the whole Dermatophagoides pteronyssinus Dep pI sequence. The T cell epitopes

                                                                                                                                                                                                                                              TNACSINGNAPABIDLROMRTVTPIRMOGGCGSCWAFSGVAATBSAYLAHRNOSLDLABO 83
The protein sequence was deduced from the cDNA sequence obtd. by screening a dermatophagoides cDNA library with two probes comprising the part of the protein allergen in used as a diagnostic reagent in detecting and treating sensitivity to house dust mites and in desensitisation therapy. of the protein were mapped by detection of the peptide's ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitive individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, halancing therapeutic or preventive efficacy or stability. See also AR34686-700, AAR36398-490 and AAR39360-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
This sequence represents the group I protein allergen from the house dust mite D. petronyssinus, Der pl. The Der pl protein shows high homology to the group I protein allergen derived from D. farinae, Der fl, having an identity of 81%. Fragments of these proteins, and the corresponding group II allergens, Der pl II and Der fl, (see AAR51731-841) represent T cell epitopes. Fusion peptides may be produced which comprise at least two or these antigenic fragments. Each region of these petides may be derived from the same, or different, mite allergens. The antigenic fragments may be produced by chemical synthesis, chemical cleavage of the protion allergen or by recombinant techniques. These peptides, when administered to a house dust mite sensitive individual, are capable of modifying the allergic response of the individual to the allergen. These peptides do not bind to immuno-globulin allergen. This reduces the major complications of standard immunocherapy, which are IgEs-mediated responses such as anaphylaxis. Exposure of mite allergen are retried as anaphylaxis. Exposure of the propried may a naphylaxis of a propried as a naphylaxis and a propried as a naphylaxis and a propried as a naphylaxis and a propried as a naphylaxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     allergic patients to these peptides may tolerise or anergise appropriate T cell subpopulations such that they become unresponsive to mite allergens and do not participate in mounting an immune response upon exposure. Administration of the peptide may also modify the lymphokine secretion profile as compared with exposure to the naturally occuring mite protein allergen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             83

AAR47063 is a preproenzyme Der pI. The amino acid sequence preceding the mature protein sequence contains cleavage sites for the pre- and procenzyme forms, with residues 1-11 corresponding to a partial signal peptide sequence. The mature protein can be used to detect sensitivity in an individual to house dust mitte and to reduce the sensitivity of the individual. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó

                                                                                                                                   Immunological tolerance to a protein antigen may be induced by admin. of a compsn. contg. at least one cryptic peptide derived from that antigen. BIO mice were immunised with various ber p i peptides and then response to ber p I and the peptides was measured in the presence of spleen adherent cells. Peptides contg. amino acids 120-143 and 144-169 of Der p expenses of spitive i.e., they contained cryptic epitopes. The cDMA fragment encoding amino acids 131-187 of Der p I was cloned into pGEX and expressed in bacteria as a fusion protein with glutathione-S-transferase. Mise were given orally 3 mg of this protein on 3 consecutive days, then 7 days later immunised subcutaneously with native Der p I in complete or synthetic peptides, were assayed for lymphokines (III-2). Mice given the cryptic epitope had a much waaker response than those treated only with buffer. (Updated on 25-MAR-2003 to correct PN field.)

The present invention describes peptides for treating sensitivity to house dust mite allergens from the genus Dernatophsgoides. Peptides within the scope of the invention comprise at least one T cell epitope, or preferably at least two T cell epitopes of a protein allergen selected from the allergens Der P I, Der P II, Der E II. The invention also describes modified peptides having similar or enhanced therapeutic properties as the corresponding, naturally occurring allergen, but having present invention. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct PR field.)

The invention relates to an isolated peptide of the major protein allergens of the genus Dermatophagoides, which comprises at least one T cell group of a protein allergen from Der p (DP) I, DP II, Der f (DP) I or DF II. The isolated peptide comprises at least two regions, each region comprising at least one T cell group of a protein allergen of the genus Dermatophagoides. The regions are derived from the same or different protein allergens of the genus Dermatophagoides. The peptides are useful for treating house dust mite allergy in humans. The peptides are also useful for detecting or diagnosing sensitivity to house dust mite protein allergens. The present peptides have similar or enhanced therapeutic properties as the naturally-occurring allergen, but have reduced side effects, and increased solubility and stability. The present sequence represents an allergenic protein from Dermatophagoides from which the T-cell epitope containing peptides are derived
                                                                                                                                                                                                                                                                                                                                                                                     Peptides comprising T cell groups of the major allergens from Dernatophagoides (house dust mites), useful for treating house dust mite allergy in humans, and for diagnosing sensitivity to house dust mite protein allergens.
                                                                                                                                                                                                                                                                      Garman RD, Greenstein JL, Kuo M, Rogers BL,

                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method (I) for detecting whether an individual is sensitive to Dermatophagoides (house dust mites). The method involves detecting sensitivity to house dust mites in patients, comprising combining a blood sample from the individual with 1 or more isolated T cell epitopes of the protein allergens I and II (IPP I) and (DP II)) from Dermatophagoides (house dust mites). 32 T cell epitopes with varying, defined amino acids sequences (given in the specification) may be used in (I). The sample and allergens are combined under conditions appropriate for the binding of blood components with the integration of the patient to house dust mites. (I) may be used to screen individuals for sensitivity to Dermatophagoides (house dust mites) in the patient to house dust mites. (I) may be used to screen individuals mite is a major cause of a variety of allergic disorders such as asthma, rhinitis and ectopic dermatitis. This sequence represents the house dust
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```

The present invention relates to a new DNA encoding a peptide from
Dermatophagoides farinae protein allergen, designated Der f I or Der f
II, that comprises at least one epitope of the protein allergen. The
invention is useful for producing a peptide from Der f I or Der f II
protein allergen. The invention is also useful for diagnosing, treating
and preventing allergic responses to mite allergens, particularly, the
mites D. farinae. The invention is also useful as a probe for identifying
additional nucleotide sequences coding for mite allergens having amino
additional nucleotide sequences coding for mite allergens having amino
competing sensitivity in an individual to house dust mites and can be
competed as sensitivity (reduce sensitivity or desensities) in an
competide is administered. The peptides when administered to sensitive
individual modify the individual's allergic response to Der f I or Der f
in The peptides are also useful as purified allergans useful in the
competide is administered. The peptides when administered to sensitive
individual modify the individual's allergic response to Der f I or Der f
in The peptides are useful as purified allergan useful in the
cangents for diagnosis and treatment of allergy to house dust mites. The
captivity to the mite species The peptides are also useful for
reagents to defining T cell epitopes and/or B cell epitopes which are
confined the mediators or mechanisms of by which these reactions occur.
The present amino acid sequence represents the Buropean house dust mite
CD ber p I protein as described in the invention ELVDCASQHGCHGDTIPRGIEYIQHNGVVQESYYRYVAREQSCRRPNAQRFGISNYCQIY 120 ELVDCASQHGCHGDTIPRGIEYIQHNGVVQESYYRVVAREQSCRRPNAQRFGISNYCQIY 143 9 83 24 TNACSINGNAPAEIDLRQMRTVTPIRMQGGCGSCWAFSGVAATESAYLAHRNQSLDLAEQ TNACSINGNAPABIDIROMRTVTPIRMOGGCGSCWAFSGVAATESAYLAHRNOSLDLAEO Gaps .. AAR49920 is a preproenzyme Der pI. The amino acid sequence preceding the mature protein sequence contains cleavage sites for the pre- and peptides with residues 1-97 corresponding to a partial signal peptide sequence. The mature protein can be used to detect sensitivity in an individual to house dust mitte and to reduce the sensitivity of the individual. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated peptide of the major protein allergens of the genus Dermatophagoides, which comprises at least one T cell group of a protein allergen from Der D (DP) I. Der I (DF) I cell group of a protein allergen from Der D (DP) II. Der I (DF) I cell group of a protein allergen of the genus Dermatophagoides. The regions are derived from the same or deflected by the genus Dermatophagoides. The peptides are useful for treating house dust mite allergy in humans. The peptides are useful for detecting or diagnosing sensitivity to house dust mite protein allergens. The present peptides have similar or enhanced therapeutic properties as the naturally-occurring allergen, but have reduced side effects, and increased solubility and stability. The present sequence represents an allergenic protein from Dermatophagoides from which the T-cell epicope containing peptides are derived, a polymorphic variant of Der p I. Note: The present sequence is not shown in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for the production of a recombinant mite Group 1 protein (I). The method comprises culturing a methylrcophic yeast microroganism transformed with a nucleic acid molecule (II) encoding (I), and recovering (I), or culturing Escherichia coli transformed with (II) under conditions in which (I) forms an inclusion body in E. coli, isolating the inclusion body, and recovering (I). Also described is a method for detecting mite allergy in an animal comprising: (a) contacting (I) with a putative IGE-containing substance of form a complex between (I) and IGE; and (b) determining the presence of IGE reactive with (I) by detecting the complex, where the presence of reactive IGE is indicative of mite allergy in the animal. (I) is useful

WPI; 2001-308475/32 N-PSDB; AAH22381 Producing recombinant mite Group 1 protein for treating allergies, involves culturing a methyltrophic yeast microorganism or Escherichia coli transformed with nucleic acid molecule, and recovering the protein.

Claim 12; Page 141-142; 154pp; English.

The present invention describes a method for the production of a recombinant mite Group 1 protein (I). The method comprises culturing a methyltrophic yeast microorganism transformed with a nucleic acid molecule (II) encoding (I), and recovering (I), or culturing Escherichia coli transformed with (II) under conditions in which (I) forms an inclusion body in E. coli, isolating the inclusion body, and recovering

(I). Also described is a method for detecting mite allergy in an animal comparising: (a) contacting (I) with a putative 1gB-contactining substance to form a complex between (I) and 1gB, and (b) determining the presence of IgE reactive with (I) by detecting the complex, where the presence of reactive IgE is indicative of mite allergy in the animal. (I) is useful for detecting mite allergy in the animal. (I) is useful for detecting mite allergy in an animal, or in a composition to reduce allergic response to a mite Group I protein in a mite allergic animal. (I) is also useful in a composition for treating or preventing allergic, infectious or other diseases. AAH22394 to AAH22394 and AAB98326 to AAB98349 represent sequences used in the exemplification of the present

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(ANTI-) ANTIALIS SARL.

Trehin Y; Terrasse G, Loria E,

WPI; 2002-750636/81.

Antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or nucleic acid coding for the allergen.

Claim 14; Page 11; 32pp; French.

The invention relates to antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or histamine acid molecule that has at least one polynucleotide sequence coding for the allergen, together with a pharmaceutical carrier. The pharmaceutical composition of the invention is useful as a non-specific antiallergic treatment, and also useful in the treatment of allergic hypersensitivity, allergic astemics, allergic stehms, allergic rhinitis, and allergic and acopical eczema. This sequence represents a peptide of a cysteine protease epitope region relating to the antiallergic

The peptide is one of a series of overlapping peptides synthsised by standard techniques to cover the whole Dermatopagoides perconyssinus Der pI sequence. The T cell epitopes of the protein were mapped by detection of the peptides ability to simulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitivit individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solublity, enhancing therapeutic or preventive efficacy or stability. See also AAR36398-490. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to an antiallergic pharmaceutical composition (I) comprising a pharmaceutical carrier containing an active agent combination of at least two of: an allergar, an antihistamine; and a histamine synthesis inhibitor. (I) is used for treating or preventing allergic hypersensitivity reactions, especially allergic asthma, allergic printing or allergic cazema, in babbies, onlidren or adults. The present sequence is a peptide fragment (epitope) of cysteine protease from Dermatophagoides pteronyssinus, which was used as an allergen in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antiallergic composition, useful for preventing and treating e.g. asthma, rhinitis or eczema, containing at least two of allergen, antihistamine and histamine synthesis inhibitor.

Isolated peptide(s) of dermatophagoides protein allergens - for diagnosis and treatment of sensitivity to house dust mite.
                                                                                                                                                                                                                                                                        The peptide is one of a series of overlapping peptides synthesised by standard techniques to cover the whole Dermatophagoides farinae Def pl sequence. The T cell epitopes of the protein were mapped by detection of the peptide's ability to stimulate T cell activity. The peptides may be allergens to diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitive individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, enhancing therapeutic or preventive efficacy or stability. See also parks 4686-700 and AAR36398-490. (Updated on 25-MAR-2003 to correct PN

The sequences given in AAX51731-841 represent T-cell epitopes derived from the group I and II protein allergens from the house dust mite D. ferromoryssinus, Der I. Der fill, Der pland Der plande and Der plande and Der plande between the house dust mite D. respectively. The Der fill proteinsCC shows high homology having an identity of 88% with an identity of 81% between the two group I proteins (see also AAX5172-30). Fusion peptides may be produced which comprise at least two or these antigeniof fragments about the same, or different, mite allergens. The petides may be derived from the same, or different, mite allergens. The antigenicity. These peptides may be produced by chemical configues. These peptides way be produced by chemical synthesis, chemical cleavage of the protien allergen or by recombinant to enhance their mite sensitive individual, are capable of modifying the allergic response of the individual to the allergen. The peptides do not bind to immunoglobulin E (192), or bind 192 to a lesser extent than the full length protein allergen. This reduces the major complications of standard immunocherapy, which are 192-mediated responses such as anaphylaxis. Exposure of mite allergens and on one participate in mounting an immune response upon exposure. Administration of the peptides may also modify the lymphokine secretion profile as compared with exposure to the confict of the allergens and complete may also modify the lymphokine secretion profile as compared with exposure to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Group I; protein allergen; house dust mite; D. pteronyssinus; Der p I; homology; D. farinae; Der f I; group II; Der p II; Der f II; T-cell; epitopes; fusion peptides; antigenic fragments; substitution; deletion; addition; chemical synthesis; chemical cleavage; recombinant techniques; allergic response; immunoglobulin B; 19E; immunotherapy; anaphylaxis; 19E-mediated responses; anergise; lymphokine secretion profile; modify;
                                      Isolated and/or modified peptides comprising T-cell epitopes - of major
protein allergens of genus Dermatophagoides, used to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in AARE1731-841 represent T-cell epitopes derived from the group I and II protein allergens from the house dust mite D. farinae and DD. pteronyssinus, Der f II, Der f II, Der p I and Der p II respectively. The Der f II proteinsCC shows high homology having an identity of 88% with an identity of 81% between the two group I proteins (see also AARE172-30). Fusion peptides may be produced which comparise at least two or these antigenic fragments. Bach region of these fusion petides may be derived from the same, or different, mite allergens. The antigenic fragments amay be altered by substitution, deletion or addition to enhance their antigenicity. These peptides may be produced by chemical synthesis, chemical cleavage of the protien allergen or by recombinant techniques. These peptides, or the fusion peptides, when administered to a house dust mite sensitive individual, are capable of modifying the allergic response of the individual to the allergen. The peptides do not bind to immunocherapy, which are 1gE-mediated responses such as standard immunocherapy, which are 1gE-mediated responses such as tolerse or anergise appropriate T cell subpopulations such that they become unresponsive to mite allergens and do not participate in mounting an immune response upon exposure. Administration of the peptides may also modify the lymphokine secretion profile as compared with exposure to the naturally occuring mite protein allergen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                              Isolated and/or modified peptides comprising T-cell epitopes - of major protein allergens of genus Dermatophagoides, used to treat or diagnose sensitivity to house dust mites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      House dust mite, Derpl, Derfl, Derpll, Derfll, allergen, allergy; overlapping peptide, screening.

Compsns. contg. house mite allergen-derived peptide(s), some of which are new - are used to treat allergy, and are stable, soluble and able to induce T cell non-responsiveness.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes peptides for treating sensitivity to house dust mite allergens from the genus Dermatophagoides. Peptides within the scope of the invention comprise at least one T cell epitope, or preferably at least two T cell epitopes of a protein allergen selected from the allergens Der p I, Der p II, Der f I, or Der f II. The invention
                                                                                                                                                                                 Claimed therapeutic compositions contain at least one of the peptides DPI-21.2 and also at least one of the new peptides DPI-23.31, DPI-26.6, DPII-20.9, DPII-22.14 and DPII-25.15. The compositions are useful for treating sensitivity to house dust mite allergens. The peptides were identified by screening overlapping peptides derived from treactivity in sensitisated group I and II allergens for T-cell reactivity in sensitised individuals. The present sequence is that of overlapping peptide DPI-2 (13-39). (Updated on 25-MAR-2003 to correct PR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       genus Dermatophagoides; major protein allergen, T cell epitope; Der p I;

The present invention describes peptides for treating sensitivity to house dust mite allergens from the genus Dermarophagoides. Peptides within the scope of the invention comprise at least one T call epitope, or preferably at least two T call epitopes of a protein allergen selected from the allergens ber p i, Der p II, Der f I, or Der f II. The invention also describes modified peptides having similar or enhanced therapeutic properties as the corresponding, naturally occurring allergen, but having represent side effects. AANT1912 to AANT2000, and AANT2257 to AANT2330 represent peptides from the present invention. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)
also describes modified peptides having similar or enhanced therapeutic proporties as the corresponding, naturally occurring allorgen, but having reduced side effects. AAW71912 to AAW72000, and AAW7227 to AAW72330 represent peptides from the present invention. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dermatophagoides allergen peptides - useful for treating house dust mite
                                                                                                                                                                                                                                                                                                                                                                                                                                                   genus Dermatophagoides, major protein allergen, T cell epitope, Der p I;
